Airflow Management**

Catalog 2013

A Message From the CEO

Subzero Engineering is dedicated to optimizing the cooling of data centers. From 2005 to present day, our team of engineers has modeled thousands of data centers with the aim of lowering energy consumption, increasing AC cooling capacity and increasing the reliability of cold supply air to IT equipment. This pursuit has led to industry-changing products that facilitate airflow management.

Subzero's corporate office and manufacturing facility resides in Draper, Utah. From here, we build and ship our containment products worldwide. We currently have offices and containment demonstration facilities in four continents.

We invite you to stop by one of our showrooms. You will meet our amazing team and discover our passion toward airflow management.

Larry Mainers, CEO

What We Do

ENGINEER

DESIGN

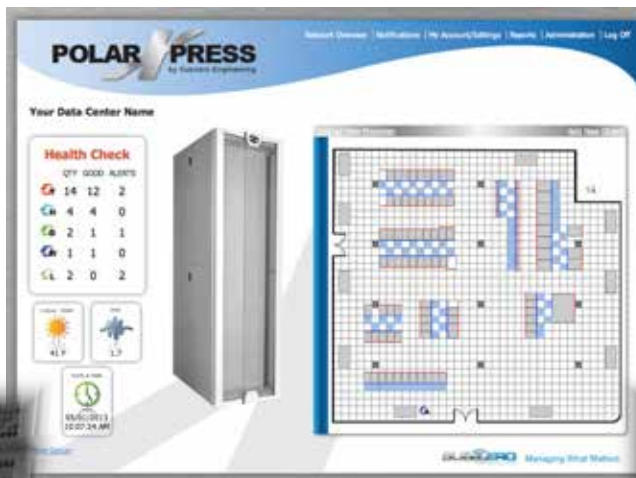

We create custom data center solutions through our unique blend of engineering, design, manufacturing, installation, and monitoring. Our creative team can provide simple, modular, or complex custom solutions. Subzero Engineering is the leader in data center airflow solutions.

MANUFACTURE

MONITOR

INSTALL

Engineering

The first step to managing what matters as it relates to data center airflow is to understand the environment. Our United States Department of Energy trained engineers are qualified as Data Center Energy Practitioners (DCEP).

This enables Subzero to evaluate the energy status and efficiency opportunities in the data center. Our engineers assist our customers to identify areas for improvement, implementation of infrastructure and operations, best management practices, and the measurement of the Power Usage Effectiveness (PUE). We use tools such as Computational Fluid Dynamics (CFD) and the DOE Data Center Energy Profiler software Tool Suite (DC Pro).

These tools enable our engineers to create a data center energy profile that gives our customers an idea of how energy is being used, as well as detailed energy assessments on critical data center systems such as cooling and electrical use.

Subzero Engineering has performed over 1,000 CFD studies.

Gordon Johnson

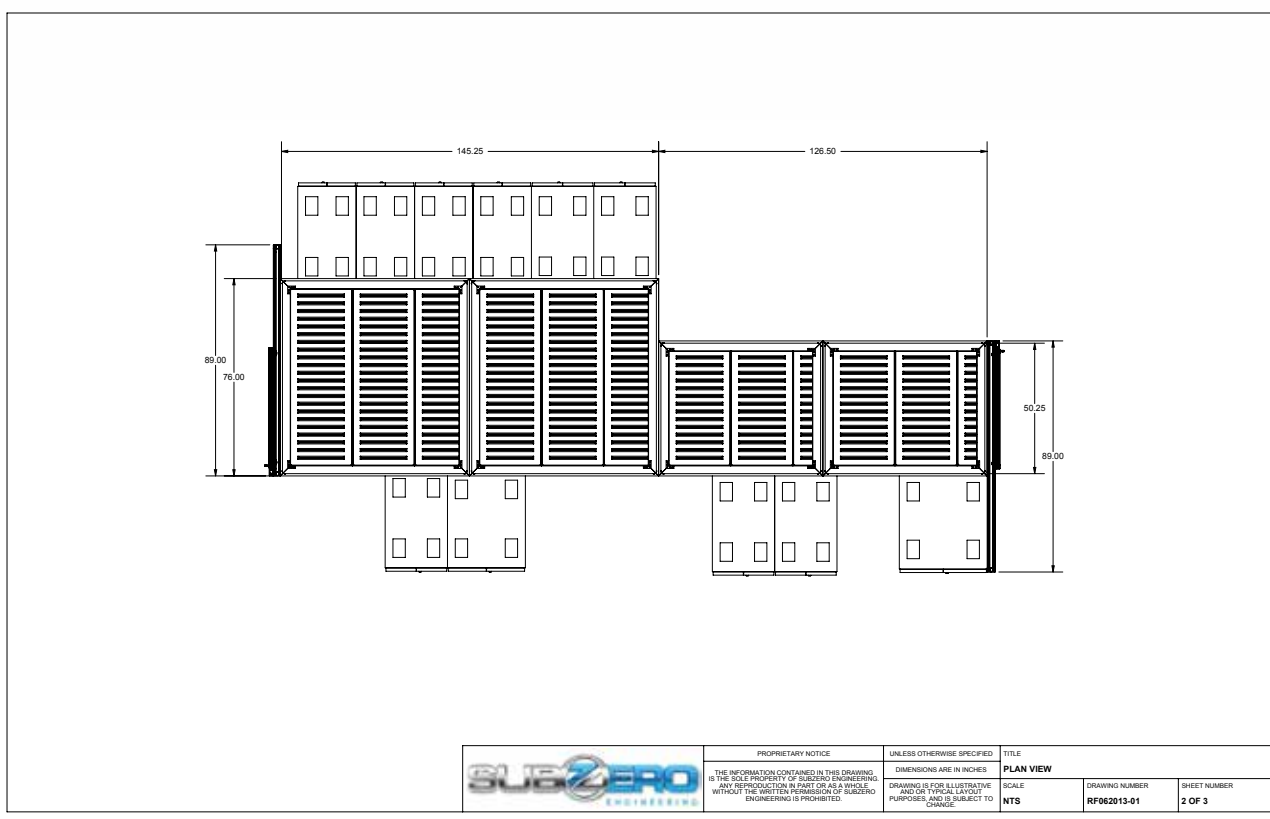

DCEP/CFD
 Professional

Design

Superior containment requires intelligent design. This ensures proper fit and finish. Our engineering department creates full-scale mechanical drawings of each containment POD. Depictions in 3D can also be created to help our customers see what their containment system will look like. Accurate drawings are the foundation of the process from quote to project completion.

These drawings are used by our installation teams for accurate on-site implementation.

Single Sliding Door

Specs

The I-40 Single Sliding Door is designed with one sliding door and is recommended for both hot and cold aisle containment. The door can be designed to slide open to the left or right for easy access to the aisle. This design works perfectly where there are obstructions or where space is limited on the face of the cabinets. The no-threshold design prevents tripping hazards, and the quality material and sturdy construction ensures a superior product. The I-40 Single Sliding Door can be custom manufactured to fit any cabinet size. The black or clear anodized finishes also complement all rack colors.

Roof Systems

The Subzero Engineering Polar Cap and Polar Roof systems provide unique, economical, and energy efficient solutions for data center hot aisle and cold aisle containment. Our roof systems are low profile designed for ease of use and to work under fire suppression systems (NFPA).

KEY BENEFITS:

- Data center containment roofs prevent warm air from recirculating into the IT equipment intake.
- Low profile design to operate under cable tray obstructions.
- Designed to work under fire suppression systems.
- Modular design to attach to door and wall systems.
- Clear panels are designed to illuminate aisle.

Polar Cap (Retractable Roof System)

Specs

Patent Pending

The Subzero Engineering Polar Cap (patent pending) is a retractable containment roof system that attaches to the top of the racks and forms a ceiling that prevents hot and cold air from mixing. The Polar Cap retractable roof system can be wired into a pre-action smoke detector system. The roof will roll up into the metal cassette in advance of the fire sprinkler. The Polar Roof can also be retracted during maintenance of lights and other periodic inspection items.

The Subzero Engineering Polar Roof system is uniquely designed to work under the fire suppression system by utilizing specially designed translucent panels.

In the event of a fire, the panels shrink and drop away to preserve the fire sprinkler pattern. The lightweight drop-in panels have a thickness of only 0.0381 and are completely clear, allowing in the light from overhead lighting systems. Additionally, they can be removed for easy access for overhead maintenance. The panels can be easily customized according to specific length and width.

The Subzero Engineering Rack Hat is the premium vinyl containment system that separates hot or cold airflow by hanging vinyl partitions from the ceiling. Aluminum tracks are mounted to the ceiling and uniquely sized vinyl is hung from the track. The fire resistant vinyl comes in these standard drop down sizes: 26", 52", 94", 106", 118", 142" and 178". The aluminum track comes in these standard lengths: 1', 2', 3', 4', 5' and 6'. The Rack Hat system provides a seamless corner for optimum efficiency and ideal aesthetics within the containment. The Rack Hat's modular and easy-to-assemble kit-based design makes it the industry's best, low-cost containment solution

The Strip Door kit includes a high-grade aluminum track, UL/FM rated fire suppression links, and an electrostatic discharge (ESD) fire resistant vinyl. The door is custom fit to your aisle ends, and it can be installed on a drop-ceiling grid or be hung onto any stationary ceiling system such as cable trays, U-Channel, or directly into a variety of ceiling materials. Our Strip Door system can be used in a variety of applications to create partitions while allowing access. The Strip Door can attach to the ceiling on the same aluminum track system as the Rack Hat partition system. Components slide together easily, securely and can quickly be reconfigured. The ESD fire resistant clear vinyl hangs down from ceiling to floor.

Panels

Hard Containment

Custom sized panels can be used to contain aisles that have fire suppression systems within it. Panels can be made out of a variety of standard materials or custom materials of your choice.

The entire Subzero Engineering product line is modular in design. This allows us to connect one piece to another without any problems. Doors, walls, roofs, even our cabinets all connect together with the same system.

Note: SKUs are determined by smallest width or height measurement. So if you have a panel that measures 5" x 58" it will fall under the SKU for (under 9"). If you have a panel that measures 32" x 58" it will fall under the SKU for (25" - 49").

Missing cabinets, uneven aisle ends, and cityscape cabinet heights presents a challenge to many containment designs.

Subzero Engineering Wall Panels easily fill in all sizes of gaps to create one continuous containment solution.

The Subzero Engineering Cube cable cutout cover is the most effective way to fill-in openings in your raised floor. The Cube comes in a variety of sizes that will cover any opening required.

The Cube is made of a fireproof material and installation is easy. Simply compress or squeeze The Cube, place into the opening, and release! The Cube will instantly fill-in all around the raised floor opening (top, bottom, and side). The Cube is specifically engineered with a 5-1/2" depth so that it fully seals the floor penetration.

- Fire Rated
- Easy to Install
- No Tools Required
- Versatile

The Subzero Engineering CRACup is an extension used on the Computer Room Air Conditioning (CRAC) unit and is a key element in the separation of hot and cold airflow.

The CRACup is designed to prevent the mixing of the CRAC unit intake air with the ambient air and exclusively directs the hot exhaust air coming from the server racks directly into the CRAC unit intake. Studies have shown that the cooling capacity of the CRAC unit increases when hotter and dryer air is going into the CRAC.

The Subzero Engineering Velocity Adjustor is the most efficient way to balance subfloor air pressure in data centers.

The Velocity Adjustor is designed to lower velocity at the AC discharge to eliminate subfloor vortices that are formed when two high velocity currents of air converge. Slowing the air increases pressure, and this in turn creates a consistent supply of air to any part of the data center. The supply airflow through the subfloor plenum is the foundation of any cooling program.

A common problem is supplying cold air to equipment that is not in a rack row or aisle. The Polar Booth contains the supply air to the equipment intake only and ensures both a uniform and predictable temperature to all isolated IT equipment.

The Polar Booth can be used to contain either cold supply air, or direct hot exhaust air away, making it a perfect solution for equipment that is not in a dedicated hot or cold aisle configuration.

Our Egg Crate Ceiling Grille airflow management solution is an important tool in helping design an energy efficient data center. It is designed to work with the natural properties of rising hot air.

The Subzero Engineering Egg Crate Ceiling Grille is used most effectively with hot aisle containment to allow hot IT equipment exhaust air to pass into the drop ceiling void and be directed back to the AC unit. This allows for warmer, dryer air to return to the AC unit. As a result, the AC unit functions more efficiently and can provide increased cooling.

Key Features:

- Easy Installation
- Standard Sizes

Options:

- 2' W x 2' L
- 2' W x 4' L

Airflow Management Products

The diagram above shows how Subzero Engineering's airflow management products can be used effectively in directing hot and cold airflow within a data center.

Arctic Enclosure

Racks & Cabinets

No airflow management offering would be complete without having an enclosure that emphasizes airflow management practices. Remember in a contained environment 60%+ of your containment integrity is based on the enclosures themselves! Check out the Arctic Enclosure and see why it was designed with airflow in mind!

The Subzero Engineering Arctic Enclosure has the market-leading open area in our door systems. Moreover the enclosure was engineered out of the box to ensure supply air can only pass through the IT load. Simply stated, the exhaust airflow is prevented from passing back across this barrier.

Additionally, our enclosures boast some of the strongest static and dynamic load ratings in the industry. We are also offering a turnkey solution where we can pre-configure rail locations, cable management solutions and even power offerings.

The Subzero Arctic Enclosure was designed to support the dynamic needs of today's data centers by supporting airflow management needs out of the box. This enclosure can support all types of data center demands from low density, to high density; data closets, to enterprise data centers. All potential air leakage areas around the front perimeter of the enclosure are completely closed off. Our market leading 81%+ open perforation pattern on all perforated door options will be the most robust feel; you will be hard pressed to find this stability even in other solid door types. This enclosure is completely customizable and can be configured with all the cable management, power, accessories and so much more as a complete turnkey solution directly to you.

Enclosure features:

- Enclosure designed from the start ensuring all 5 airflow fault areas are sealed
- Sleek, one of a kind, push-to-open standard offering (alternative handles also available)
- Market leading 81%+ perforation pattern
- Assorted door styles available:
 - Single full perforated
 - Split full perforated
 - Split solid
- Market leading dynamic & static load rating
- Simple & easy integration to all containment solutions
- Top panel with customizable opening areas that have day 2 removability
- Full assortment of divider and side panel offering available including cable pass-through options
- 19 inch EIA-310 vertical mounting rails with RU designated markings
- Our own mesh cable management offering available, and can be pre-installed where you want
- Grounding pre-installed
- Color: Subzero polar white, black, & color matching available (Multi-color capabilities - enclosure frame, mesh, door frame, accessories, etc.)
- Shipping weight: 318 lbs.

Key Features

- EIA 310-D compliant for 19" equipment
- Mounting Hardware:
 - #10-32 cage nuts and screws (qty. 50)
- Static weight load capacity: 3,000 pounds
- Dynamic weight load capacity: 2,400 pounds

INTERNAL HEIGHT	EXTERNAL HEIGHT	EXTERNAL WIDTH	EXTERNAL DEPTH

30" (762 mm)					

Rack-Based Containment

An airflow management portfolio is not complete without incorporating all three varieties of containment system options: cold aisle, hot aisle, and rack-based containment.

Our chimney solutions are fully height adjustable to minimize impact on site conditions without having to drill or allow for penetrations within the airflow pathway. The chimney offering is near tool-less and installs in a minute or less on all of our enclosures, even Day 2. Our rack-based containment solutions can be used 1 to 1 (1:1) directly connected to the return plenum, but can also support a 1 to many (1:n) configuration through a shared rear plenum within our enclosures.

The possibilities are endless with Subzero Engineering.

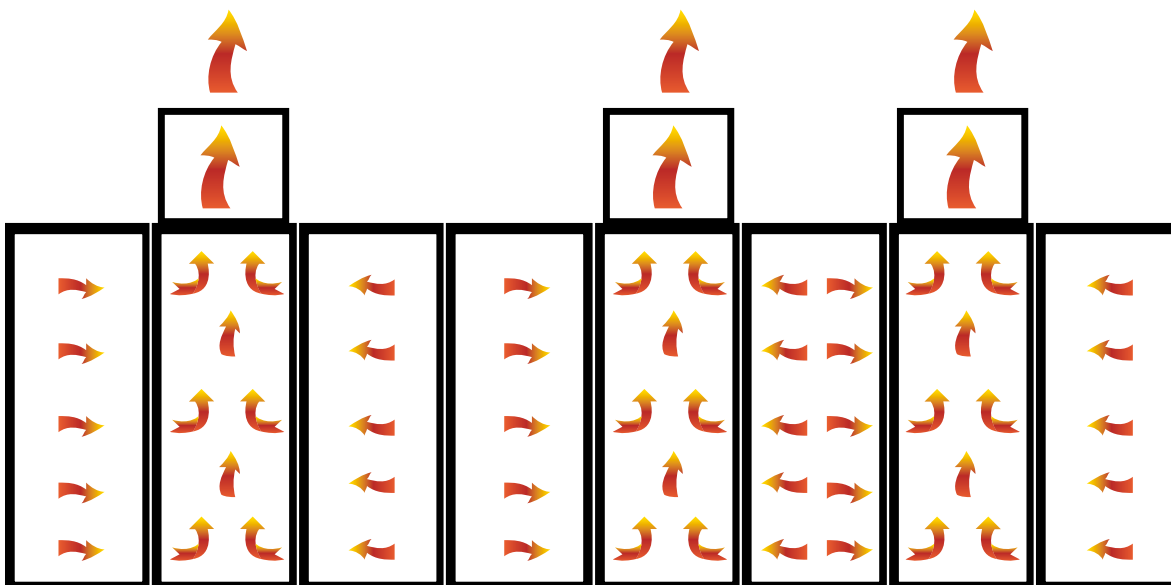

The Rack-Based Containment System is a chimney solutions that is completely height adjustable to minimize impact on site conditions without having to drill or allow for penetrations within the airflow pathway.

The chimney offering is near tool-less and installs in a minute or less on all Subzero Arctic Enclosures, even Day Two (2).

The Rack-Based Containment solutions can be used 1 to 1 (1:1) directly connected to the return plenum, but can also support a 1 to many (1:n) configuration through a shared rear plenum within our enclosures.

Key Features

- Can be mounted on all Subzero Arctic Enclosures on Day 1 or 2 and can adapt to all 3rd Party Enclosures
- Mounting hardware: included and system is fully height adjustable and installs in a minute or less
- For enclosure densities up to 25kW and beyond

Chimney systems can be adapted to allow more than one cabinet to discharge heat through one chimney.

Professional Installation

Even great product requires professional installation. One thing we have learned over the years is that nothing is perfectly plumb. Often an installation requires working around cabinets that are not set properly, ceilings that are not flat, floors that are not square and gaps that are not called out in drawings.

Let our professional team work through all the fit and finish issues. The end result will be a great looking functional system that will last a long, long time. In fact, use our installers, double your warranty!

Wireless Monitoring Environmental Monitoring System

Data Center Infrastructure Management (DCiM) is a growing trend that helps data center managers keep track of power, cooling, and IT equipment requirements and changes. Subzero Engineering simplifies the tracking of the power and cooling environmental information. Our PolarXpress system can be monitored at your desktop, iPhone, or even on our Intelligent Containment Environment (ICE) Door.

With just a glance you can determine if any cabinet intake temperature, relative humidity, or PUE is within acceptable operating conditions.

Inexpensive, accurate, easy to deploy, easy to read.

Easy to read, easy to deploy.

PolarXpress is a wireless, web-based environmental monitoring system with real time PUE measurement. It allows you to monitor:

- Temperature
- Humidity
- Power usage effectiveness
- Water leak detection
- Object presence with IR motion
- Open/closed positions of racks or doors
- Data center lighting status

It provides Email and SMS alerts if any user set threshold is crossed. It trends and graphs the various changes to any of the data points monitored.

The sensors are wireless, allowing for quick and easy set up. We do all of the set up work before any hardware arrives. Your specific data center floor plan is developed and uploaded into the data base. Your racks are then created and placed on the floor plan. Sensors are logged in to the appropriate places on the racks within the program and then tagged so that they can be installed in the appropriate location on the floor. Once the gateways are plugged in the system immediately starts reporting back to the web based user interface. And best of all, we take care of all of it for you. You pay as little as \$10 a month per sensor and we manage it for you. Sensor failure...not your problem we send a new one free. New sensors become available, no worries we will add them in at no charge, only their monthly cost. Trouble shooting and tech support are included.

ICE Door

Patent Pending

Intelligent Containment Environment

Subzero Engineering introduces a cutting-edge product that gives you an information access portal at the end of every aisle – the patent pending ICE Door.

Maintain your airflow management integrity and reap the most from your containment solution. The ICE Door provides an information access portal for your entire aisle at the aisle end door. By providing you access to the critical information you demand outside the aisle you can dramatically reduce the number of times you break your containment barrier.

ICE Door

At Subzero Engineering we are advocates of the philosophy that the best way to reduce energy consumption and increase cooling capacity is to install a custom designed containment solution in your data center. We also uphold the philosophy that you should maintain the integrity of your containment solution by limiting how often you break the containment barrier. The ICE Door provides an information access portal for your entire aisle at the aisle end door. By providing you access to the critical information you demand outside the aisle, instead of inside the aisle, you can dramatically reduce the number of times you break your containment barrier.

The ICE Door provides an aisle end door-mounted tablet computer capable of displaying information relevant to the environmental and operational conditions existing within the containment area. This information can include rack inlet and outlet temperature and humidity, above and below raised floor differential pressure, rack doors open and closed indication, light presence, motion presence and water leak detection. Depending on the hardware and software utilized in conjunction with the tablet computer display, the potential also exists to provide control commands to the data center cooling chain such as CRAC and CRAH temperature and humidification set points, chilled water set points, fan speed set points and pump speed set points.

Many DCiM software platforms are web-enabled, allowing you the capability to present their data by means of any web browser that has been provided access to the platform. The ICE Door can utilize any browser supported by the tablet computer to monitor and control the data provided by the DCiM operational platform that is web-enabled and allows this feature. With multi platform functionality, you can decide which tablet computer works best for your data center.

Technical Furniture

Subzero Engineering introduces a new line of technical furniture designed to enhance workflow in the data center environment. Utilizing our industry expertise, Subzero has designed a unique line of technical furniture that is perfectly suited for the data center environment. Each item is fully customizable and is made of aluminum to ensure full recyclability.

Combined, our team of designers and our manufacturing prowess gives us the ability to create numerous technical furniture solutions.

- Technical Lab Benches
- Flat Panel Work Stations
- Modular Cart Solutions
- Custom Wall and Privacy Panels
- Custom Furniture

The Data Center Display Desk features a modular design that can be incorporated with a host of options allowing you to build a custom display solution. The electronic height-adjustable work surface offers adjustments with just a touch of a button and allows the user to save 3 positions in memory.

The Data Center Display Desk chassis is comprised of aluminum construction, with a non-magnetic, non-corrosive, non-toxic design, superior strength, and is entirely recyclable.
